Abstract	
<p>Analysis of the shark bycatch taken during two trips on a benthic-pelagic factory trawler in 2012 and 2014 provided a first detailed and reliable identification of the shark species composition of the bycatch.</p> <p>Data were collected during two trips and 113 days at sea: data from 3493 deep-sea shark were recorded. 31 species were recorded from 14 genera. Length, maturity, reproduction, distribution and dietary data were recorded. Over a dozen of the species encountered were previously undescribed.</p> <p>The results of this analysis imply that a single, simple conservation measure for deep-sea sharks will not be feasible and that discussion is needed to identify/document the objectives of shark conservation in this fishery, what may be achievable and how it might be obtained.</p> <p>This paper to be considered in conjunction with the SC8 meeting</p>
